U.S. Permanent Resident (Green Card, No Sponsorship Required) | Open to Relocation

## Education

### Birzeit University

Sep 2022 – Jun 2026

Bachelor of Science in Computer Science

GPA: 3.1/4.0

**Relevant Coursework:** Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, Database Systems, Web Application & Technology, Web Services, Artificial Intelligence

## Summary of Qualifications

**Languages:** Java 17+, Python, SQL, JavaScript

**Backend:** Spring Boot, Spring MVC, Spring Data JPA, Spring Security, Spring WebClient, FastAPI, Gradle

**APIs & Architecture:** REST APIs, Microservices, RBAC, JWT, OAuth2, API Versioning, Pagination, Swagger/OpenAPI

**Databases:** PostgreSQL, MySQL, MongoDB (NoSQL), Redis, Liquibase

**Cloud & DevOps:** AWS (ECS, EC2, S3, IAM, CloudWatch), Docker, Kubernetes, Terraform, GitHub Actions CI/CD, Linux

**Testing & Monitoring:** JUnit 5, Mockito, SonarQube, TDD, Postman, Spring Boot Actuator

**Tools & Practices:** Git, Jira, Agile/Scrum

## Work Experiences

### Backend Engineering (Part-time) | Java, Spring Boot, PostgreSQL, Redis, AWS

Jul 2024 – Jul 2026

Al Shini - Retail Platform

Remote

- Built and shipped **10+ production microservices** in Java 17, Spring Boot, and PostgreSQL serving tens of thousands of requests a day, including a reporting service and a core API that automated order, return, and customer-account workflows
- Designed and implemented versioned REST endpoints with server-side pagination, secured with Spring Security/JWT/OAuth2, and fully documented in Swagger/OpenAPI for frontend and QA, holding **p95 latency under 150ms** in production
- Reduced response times by **25%** on key order and reporting endpoints by eliminating JPA N+1 queries, optimizing SQL and indexes, and adding Redis caching across two REST services
- Automated GitHub Actions deployments with testing, SonarQube, Docker, rollback-ready AWS ECS releases, and Terraform infrastructure, reducing setup from days to minutes and manual deployment work by **40%**
- Maintained **85% test coverage** with JUnit 5 and Mockito, enforced by SonarQube gates in CI, and added Spring Boot Actuator and CloudWatch Logs monitoring for service health and performance; collaborated in Agile/Scrum teams using Jira

## Projects

### SATs, Adaptive Learning Platform | Java 17, Spring Boot, Spring Data JPA, MySQL, Flutter

- Audited the API for security flaws and fixed them: blocked **privilege escalation**, stopped refresh tokens acting as access tokens, and verified each answer belongs to the student's own attempt and quiz, with regression tests in a **240+ test suite**
- Refactored the user model to JPA joined-table inheritance (a users table plus student, teacher, parent, and admin tables) and wrote the MySQL migration that copied existing rows and preserved primary keys, so every existing foreign key kept working
- Built Python pipelines that extracted **3,000+ questions** from PDF textbooks and integrated Gemini through Spring WebClient to generate more at quiz time, saving only questions that pass validation, with a 10-second timeout and a question-bank fallback

### LRMIS, Land Registration System (Team of 3) | Python, FastAPI, MongoDB, React

- Built the workflow engine at the core of the platform: **12 application states**, per-state guards that reject invalid transitions server-side, and an append-only audit trail of every state change
- Built **11 analytics endpoints** on 13 MongoDB aggregation pipelines (KPIs, processing time, staff workload, trends, map feeds, CSV export) with a 60-second TTL cache
- Implemented the MongoDB layer: **15 collections** with unique, TTL, and 2dsphere indexes, atomic ID counters, and GeoJSON polygon validation that stops invalid parcels reaching the survey step
